This Environmental and Social Impact Assessment report is submitted to the National Environment Management Authority (NEMA) pursuant to the requirements of the Environment Management and Coordination Act, chapter 387 and the Environmental (Impact Assessment and Audit) Regulations, 2003

EXECUTIVE SUMMARY

Introduction

The proponent, Spruce Properties LLP proposes to develop student residences, convenience shops and restaurant on land adjacent to Catholic University of East Africa (CUEA) on LR. No. 7820/1, measuring 3 acres located in Karen along Bogani East Road. The parcel of land was acquired from CUEA with the sole understanding that it be developed into student hostels as the University had previously intended. The proposal is to develop the property into two residential brands, namely Qwertu and Qejami incorporating amenities blocks and a retail block that will serve the students within the property. The change of user to carry out the development had been submitted and approved by the County Government of Nairobi as attached in the appendix.

In general, the proposal has split the development into four components. That is:

1. Student residential blocks comprising of:
   - 9 residential blocks of G+4 located along Bogani East Road
   - 3 residential blocks of G+5 located at the rear section of the property fronting Catholic University of East Africa
   - The total student population - 3,591 beds
   - Ground coverage for the blocks is 40% with the rest being landscaped area
   - Plot ratio 1.67

2. Two Amenities Blocks that will provide the students facilities such as study rooms, common lounges and gym.

3. Convenience retail block offering ancillary services including a minimart, restaurant, pharmacy, and launderette to serve the students population.

4. Installation of an effluent treatment plant (and other support infrastructure) – an effluent treatment plant (ETP) that will encompass physical, biological and chemical treatment of waste water from the residences shall be installed. The ETP shall be designed with adequate capacity for sufficient treatment of all waste water from the project. The project will drill its own borehole and install a water treatment plant for domestic water usage within the premises.

Environmental Impact Assessment (EIA) must be undertaken at the planning stages of the proposed undertaking pursuant to section 58(1) of the Environment Management and Coordination Act (EMCA Cap 387). This is to ensure that significant impacts on the environment are taken into consideration during all the phases of such projects. Therefore, in compliance with the law and to avoid unnecessary conflicts that retard development, the proponent has undertaken this Environmental and Social Impact Assessment (ESIA) study as required.

EIA is a tool for environmental conservation and has been identified as a key component in new project implementation. Consistent with section 58 of the EMCA chapter 387 second schedule 9 (1), and Environmental (Impact Assessment and Audit) regulation, 2003, new projects must undergo EIA process. The Report of the same must be submitted to National Environment Management Authority (NEMA) for approval and issuance of relevant licenses. This was necessary as many forms of
developmental activities cause damage to the environment and hence the greatest challenge today is to maintain sustainable development without interfering with the environment.

Positive Impacts

The government has undertaken to “promote university education for the benefit of the people of Kenya through the establishment and progressive development of public universities....” However, the Government is not expressly obligated to provide residences for students. This has made it very expensive to the students pursuing higher education within the colleges around Karen area. This project is tailored towards ensuring the attainment of the right to education and housing for such students. Qwetu and Qejani seeks to fill the lacunae in the Universities (Establishment of Universities) Standardization, Accreditation and Supervision Rules, 1989 which does not list housing and/or accommodation as a resource to be considered by the Commission for Higher Education when reviewing an application for the establishment of a university.

The proposed project will also come along with numerous positive impacts as exhaustively discussed in the report. They include: employment opportunities, revenue generation to the local and central governments, optimal use of land, economic benefit to the proponent and increased affordable student residential units increasing enrolment capacities of Universities in the vicinity to offer affordable higher education. A student with a safe residence can concentrate on his studies and will be keen to ensure that the areas general security around him/her is guaranteed.

Summary of negative impacts & mitigation measures

The proposed project neighbours several higher learning institutions hence is being developed in an area that is already designated for such developments thus, no conflict in land use is anticipated. The Table 1 below is a summary of anticipated impacts as well as proposed mitigation measures.

<table>
<thead>
<tr>
<th>Possible Impacts</th>
<th>Mitigation measures</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil erosion</td>
<td>Control earthworks; Install drainage structures to control flow of storm water; Ensure management of excavation activities</td>
</tr>
<tr>
<td>Loss of vegetation</td>
<td>Only areas earmarked for development should be cleared; Plant trees, shrubs and flowers on remaining open spaces</td>
</tr>
<tr>
<td>Air pollution</td>
<td>Stockpiles of earth should be sprayed with water or covered during dry seasons; Provide dust masks for the personnel in dusty areas; Sensitize construction workers on pollution control measures, Cover all trucks hauling soil, sand and other loose materials; Provide dust screen where necessary</td>
</tr>
<tr>
<td>Noise pollution</td>
<td>Install portable barriers to shield compressors and other small stationary equipment where necessary; Display signs to indicate construction activities; Maintain all equipment; Adhere to provisions of Noise Prevention and Control Rules 2005, Legal notice no. 24 regarding noise limits at the workplace as well as NEMA Noise and Excessive Vibration Pollution Control Regulations, 2000.</td>
</tr>
<tr>
<td>Aspect</td>
<td>Mitigation Measures</td>
</tr>
<tr>

<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Road traffic disruption</td>
<td>No overloading of trucks and good driving practices to be practiced. Suitable junction/access point to be provided. Use of appropriate &amp; legible signage. Employment of formal flagmen / women to ensure the public safety.</td>
</tr>
<tr>
<td>Increased generation of waste water</td>
<td>Installation of a waste water treatment plant of adequate capacity. Adhering to the water quality regulations of 2006</td>
</tr>
<tr>
<td>Increased generation of waste</td>
<td>Adopt waste minimization at source; Monitoring the fate of disposed wastes to ensure they are legally land filled at a recognized controlled site. Adhering to waste management regulations of 2006</td>
</tr>
<tr>
<td>Public health and occupational safety</td>
<td>Ensure proper solid waste disposal and collection facilities; Ensure that waste bin cubicles are protected from animals, rains and are well covered; Provide suitable safety gear for all personnel; Proper treatment of waste water</td>
</tr>
</tbody>
</table>

**Recommendations**

1) The proponent to implement the measures outlined in the Environment Management Plan (EMP) as well as adhering to all relevant national and international environmental, health and safety standards, policies and regulations that govern establishment and operation of such projects.

2) Maximize positive impacts as much as possible as exhaustively outlined within the report. This will ensure the best possible environmental compliance and performance standards.

3) Recover methane gas from effluent treatment and use it for cooking and or lighting. Anaerobic treatment of effluent is likely to produce methane gas. The gas can be recovered and used for cooking, a process that will break it down to carbon dioxide that has a lower global warming potential.

4) Additionally, use solar PV especially for lighting streets and pavements/ walkway lighting. This will reduce demand for fossil fuels in power generation hence curbing GHG emissions.

**Conclusion**

Considering the positive socio-economic and environmental benefits to accrue as a result of the development, and the EIA having found no major impacts to arise from the development, it is our recommendation that the project be allowed to proceed on the understanding that the proponent will adhere to the recommended mitigation measures and will further implement the proposed EMP.
1. INTRODUCTION

1.1. Background

The proponent, Spruce Properties LLP, proposes to develop student residences, convenience stores and restaurant on Catholic University of East Africa (CUEA) property, L.R. No. 7820/1, measuring 5 acres located in Karen along Bogani East Road. The proposal is to develop the property into two residential brands, namely Qwetu and Qejan, and two amenity blocks and a retail block that will serve the students within the development.

In general the proposal is split into five components. That is:

1. Student residential blocks comprising of:
   - 9 residential blocks of G+4 located along Bogani East Road
   - 3 residential blocks of G+5 located at the rear section of the property fronting Catholic University of East Africa.
   - The total student population - 3,591 beds
   - Ground coverage for the blocks is 40% with the rest being landscaped area
   - Plot ratio – 1.67
2. Two Amenities Blocks that will provide the students facilities such as study rooms, common lounges and gym
3. Convenience retail block comprising of a minimart, restaurant, pharmacy, salon, food stalls and laundrette to serve the students population
4. Drilling of a borehole and water treatment plant – this is occasioned by the unreliability of Nairobi County water supply in the vicinity. A separate EIA project report of this activity shall be submitted to the authority and a drilling permit sought from Water Resources Authority (WRA). However, its importance and impacts in relation to the project shall be discussed during the study process and in the report.
5. Installation of a waste water treatment plant – a waste water treatment plant (WWTP) that will encompass physical, biological and chemical treatment of waste water from the residences shall be installed. The WWTP has been designed with adequate capacity (approximately 250m³ as advised by the project engineers) for sufficient treatment of all waste water from the project. The resultant treated water shall be used for irrigating lawns and cleaning of pavements.

1.2. The need for the project

University enrollment in Kenya has increased from 27,000 in 1989 to 560,000 in 2016 with no corresponding investment in accommodation leading to a huge gap. The Karen region alone, predominantly owing to the land availability and its serene environment suitable for higher learning, has witnessed a tremendous increase in student population as shown in Table 3 captured in section 3.3.1;

The majority of the student population lives in and around the Ngong and Rongai town areas, hence the need to commute to school. This poses a security risk for the students as they do so, especially for those with evening classes who must face the risk of commuting with laptops which are essential for their learning. With the increase in commuting time, students are subjected to higher commuting costs. The length of commuting time also has a significant effect on commuters’ satisfaction, other security risks, and efficiency during learning hours. Thus, for students, a tolerance threshold of commuting time must exist at cognitive and
mental levels. The tolerance threshold of commuting time represents the maximum amount of one-way commuting time that an individual can tolerate. This has also increased traffic build up within the Karen area and the proliferation of "mutatis" within this region. As such, the proposed student residences will solve these problems as the students will be within walking distance to their respective colleges and learning institutions.

Feeling the pressure, some institutions have resorted to converting structures not quite meant for accommodating students into hostels. In others, formerly domestic staff quarters or extensions in the back yards of family homes serve as additional ‘student hostels’. Often, students are forced to share the houses with either families or amongst themselves.

Many of these old structures lack modern amenities such as reliable running water, studying areas, privacy, WI-FI and much more. Such facilities are totally out of sync with the vibrant, creative, expressive and aspirational nature of university students. It is also clear that in these conditions, students cannot enjoy the privacy, comfort, convenience and the security they require to succeed in university and beyond.

In order to bridge the clear gap in the market, Spruce has embarked on the provision of student accommodation with the Qwetu and QeJani product. Qwetu will offer 4 room typologies i.e. premium, single, twin and cluster, while QeJani will have two room typologies i.e. double and quadruple. The two products will be served with amenities such as gym, lounge, backup generator, treated borehole water, lifts, high speed, CCTV, biometric and card access and retail spaces.

The proposed site has adequate space for the proposed development, with the existing and proposed service infrastructure such as water and power supply, waste management and wastewater disposal to accommodate the proposed amenities. The screening process revealed that the project requires an EIA study in line with the second schedule of the environment management and coordination Act chapter 387.

EIA is a tool for environmental conservation and has been identified as a key component in new project implementation. According to section 58 of the Environmental Management and Coordination Act (EMCA) No.8 chapter 387 second schedule 9 (1), and Environmental (Impact Assessment and Audit) regulation, 2003, new projects must undergo Environmental Impact Assessment. The report of the same must be submitted to National Environment Management Authority (NEMA) for approval and issuance of relevant license.

1.3. Criteria for the EIA

1.3.1. Scope

The Kenya Government policy on all new projects, programmes or activities requires that an environmental impact assessment be carried out at the planning stages of the proposed undertaking to ensure that significant impacts on the environment are taken into consideration during the design, construction, operation and decommissioning of the facility. The scope of this Environmental Impact Assessment, therefore, covered:

- The baseline environmental conditions of the area,
- Description of the proposed project,
- Provisions of the relevant environmental laws,
- Identification and discussion of any adverse impacts to the environment anticipated from the proposed project,
- Appropriate mitigation measures,
- Provision of an environmental management plan outline.

1.3.2. Terms of Reference (TOR) for the EIA Process

The terms of reference for the study were developed during the scoping exercise and approved by the licensing authority in line with requirements of part III of the EIA and EA regulations 2003. The TOR’s were used as a guide for the study and are appended to this report.

1.3.3. Data Collection

Due to the Covid – 19 pandemic, we will adhere to the regulations governing public participation as stipulated by the Authority, NEMA. Data collection will be carried out through questionnaires, use of checklists, observations and photography, site visits and desktop environmental studies in the manner specified in Part V (section 31-41) of the Environmental (Impact Assessment and Audit) Regulations, 2003. Use of ICT will be deployed with the guidance of the Authority to incorporate as many participants as possible in the public consultation process.

1.3.4. Reporting and Documentation

The EIA Project Report from the findings was compiled in accordance with the guidelines issued by NEMA for such works and was prepared for submission by the proponent for consideration and approval. The Consultant ensured constant briefing of the client during the exercise.

1.3.5. Study objectives

1. To identify all potential significant adverse environmental and social impacts of the project and recommend measures for mitigation;
2. To generate baseline data that will be used to monitor and evaluate the mitigation measures implemented during the project cycle;
3. To recommend cost effective measures to be used to mitigate against the anticipated negative impacts;

1.3.6. Methodology

The general steps followed during the assessment were as follows:
- Environment screening, in which the project was identified as among those requiring environmental impact assessment under schedule 2 of EMCA, chapter 387
- Environmental scoping that provided the key environmental issues
- Desktop studies and interviews with project architects and engineers
• Review of relevant policies, laws, regulations, developmental frameworks as well as multilateral agreements
• Physical inspection of the site and surrounding areas
• EIA Public participation
• Reporting of study findings
2. PROPOSED PROJECT DESCRIPTION

2.1. Project site location

The property, L.R. No. 7820/1 is located in Karen along Bogani East Road measuring 5 acres. It slopes towards CUEA to the north end of the site and has an unoccupied bungalow and it is well served with utilities such as electricity and an access road as presented in Figure 1 below. The parcel is approximately 6 minutes’ walk to Catholic University of East Africa (CUEA).

Figure 2: Proposed project site

2.2. Design components of the project

In general, the proposal is split into five components. That is:

1. Student residential blocks comprising of:
   - 9 residential blocks of G+4 located along Bogani East Road
   - 3 residential blocks of G+5 located at the rear sloped section of the property fronting Catholic University of East Africa. (This will ensure all the blocks have the same level)
   - The total student population - 3,591 beds
   - Ground coverage for the blocks is 40% with the rest being landscaped area
   - Plot ratio – 1.67

2. Two Amenities Blocks that will provide the students facilities such as study rooms, common lounges and gym
3. Convenience retail block comprising of ancillary services including a minimart, restaurant, pharmacy, and launderette to serve the students population and the neighbourhood.

4. **Drilling of a borehole and installation of a water treatment plant** – this is occasioned by the unreliability of municipal water. A separate EIA project report on this activity shall be submitted to the authority. However, its importance and impacts in relation to the project shall be discussed during the study process and in the report.

5. **Installation of a waste water treatment plant (WWTP)** – an effluent treatment plant that will encompass physical, biological and chemical treatment of waste water from the residences shall be installed. The WWTP shall be designed with adequate capacity (approximately 250m$^3$) for sufficient treatment of all waste water from the project.

The salient features of the proposed project are presented in **Table 2** below.

This project is estimated to cost Kenya Shillings 1,890,884,600.

### 2.2.1. Electrical system

Construction power will be from the Kenya Power and Lighting Company (KPLC). The project will utilize permanent power supplied by the Kenya power company limited. The various components of the electrical system shall comprise single and twin socket outlet, lockable meter board with glass view panel, gate lights and security alarm panel outlet and CCTV connection system and lifts. The necessary guidelines and precautionary measures relating to the use of electricity shall be adhered to. There shall be back up generators at the facility that automatically come on in-case of power blackouts to ensure all facilities including lifts are operations at all times.

### 2.2.2. Water supply

Water for construction will be from the municipal supply line. In addition, water extracted from a borehole will be used to supplement this source especially where cleaner water will be required. There will be water storage tanks to increase water capacity at the project site to the required amount. There will be a water treatment plant on-site for the borehole water during occupation.
2.2.3. Waste water and solid waste

Waste water from the project site will be connected to a waste water treatment plant (WWTP). The waste water treatment plant is designed with 5 key components. That is:

a) pre-treatment,
b) primary treatment
c) biological treatment i.e. anaerobic and aerobic
d) secondary treatment and
e) tertiary treatment.

![Waste water treatment overview diagram](image)

**Figure 3: Waste water treatment overview**

Some key unit operations in the treatment of waste water will include the following.

**Flow equalization** - Flow equalization will be provided to balance / smooth high levels of variations in the influent wastewater flows, expected during the peak flow periods. These flows will be temporarily stored and then discharged later into the biological treatment system at a controlled flow rate. Estimated plant volume at 250m$^3$ equalization tank forms 30% of this volume at 75m$^3$. In this way, the biological treatment process will not be overloaded during peak flows (flushes) of influent arriving at the treatment facilities.

**Screening & Greet Removal**

The wastewater will be screened using a stainless-steel static screen to remove rags and plastics and prevent blockage in the downstream treatment processes. Screening to
approximately 5 – 6 mm is required for good downstream process operation. Screening will be cleaned daily to avoid odor.

**Aeration in bioreactors**

The aeration bioreactors are fixed-film reactors, each equipped with a simple system of non-clogging, diffusers used to introduce air in the water. The wastewater is introduced in the reactors and the microorganisms growing as a biological film on the media absorb the organic material in the wastewater and ammonia nitrogen is converted to nitrates and nitrates. Reactors BR series consists of tanks with bed of bio-filter, which serves as a platform for micro-organisms to attach to and grow on, to form a biological film. These tanks are connected in series and water is transferred by gravity through the interconnecting 110mm pipe. The various chambers of the plant which is an underground system are made of concrete material.

**Sedimentation in the Settling tank**

The secondary clarifier receives the water from the last fixed bed reactor and provides a settlement zone with a funnel shaped bottom for the settlement of the excess bacteria which have been spoiled out of the fixed bed reactors. Submersible motor pumps at the bottom of the chamber remove the accumulated sludge in intervals into the sludge digester tank. This is set at a certain level depending on dimensions of the settling tank (secondary clarifier).

**Sludge treatment**

The sludge, which gathers at the bottom of the primary and the secondary settling tanks, is pumped several times per day into the sludge digester tank. The sludge treatment reactor consists aeration grids of membrane tube aeration at the bottom. The aeration grids are supplied with air from an air blower. Existing bacteria degrade the remaining polluting substances contained in the sludge using the oxygen brought into the water. By intervals of long aerated and long non-aerated phases the sludge starts to mineralize and reduces its volume. At the end of the sedimentation phase the supernatant water from the clear water zone is pumped into the equalization tank by pump.

**Chlorine Disinfection**

Clarified water from the settling tank is discharged into the chlorine contact tank (DT-1700). This tank is sized for an effective contact time in excess of the required 20 min maintaining a 2ppm residual chlorine concentration before discharge. 1.0kg of 65% chlorine granules is mixed in the 100liter-dosing tank to form the dosing solution.

Treated waste water will be used for watering lawns, flower beds and cleaning of pavements. All storm water drainage will be channelled into open storm water drain systems. This will be served by 2 submersible drainage pumps pressurizing the system. Excess amount of treated water is directed to external storm water drainage system. The quality of the treated waste water shall be regularly monitored pursuant to the water quality regulations of 2006.

**Solid waste** - The main waste from construction activities will be excavated soil. Excavated soils will be used to backfill and landscape after decommissioning of construction activities.
During occupation, large amounts of solid waste will emanate from the residencies. Each residencies will have its own waste bin. Tenants will be required to deposit their waste at a designated point on certain days of the week. From here, a licensed waste handler will transport the waste to designated waste treatment site.

2.3. Description of the project’s construction activities

2.3.1. Excavation and foundation works

Excavation will be carried out to prepare the site for construction of foundations, pavements and drainage systems. This will involve a combination of earthmoving machinery such as bulldozers and wheel loaders as well as manual labour.

2.3.2. Storage of materials

Building materials will be stored on site. Bulky materials such as rough stones, ballast, sand and steel will be carefully piled on site. To avoid piling large quantities of materials on site, the proponent will order bulky materials such as sand, gravel and stones in quotas. Materials such as cement, paint and glasses among others will be stored in temporary storage structures built for this purpose.

2.3.3. Masonry, concrete work and related activities

The construction of the building walls, foundations, floors, pavements, drainage systems, among other components of the project involves a lot of masonry work. General masonry includes stone shaping, concrete mixing, plastering, slab construction, construction of foundations, and erection of building walls and curing of fresh concrete surfaces. These activities are known to be labour intensive and are supplemented by machinery such as concrete mixers, cranes and hoists.

2.3.4. Structural steel works

The residencies blocks will be reinforced with structural steel for stability. Structural steel works involve steel cutting, welding and erection.

2.3.5. Plumbing

Installation of pipe-work will be done to connect sewage from the student blocks to the WWTP described in section 2.2.3 above. Plumbing will also be done for drainage of storm water from the rooftop into the peripheral storm water harvesting tanks. Plumbing activities will include metal and plastic pipe cuttings, the use of adhesives, metal grinding and wall drilling among others.

2.4. Description of the project’s operational activities

2.4.1. Solid waste and waste water management

The proponent will provide facilities for handling solid waste generated within the project area. These will include dust bins/skips for temporarily holding waste within the premises before final disposal at the designated sites. Waste water generated from the hostels will be
discharged into the waste water treatment plant (described in section 2.2.3 above) while storm water from the building’s roof will be channelled into rainwater harvesting tanks to avoid wastage and surface run off.

2.4.2. Cleaning

The proponent will be responsible for ensuring regular washing and cleaning of the pavements, the car park area, staircases etc. Cleaning operations will involve the use of substantial amounts of water, disinfectants and detergents.

2.4.3. General repairs and maintenance

The buildings and associated facilities will be repaired and maintained regularly during the operational phase of the project. Such activities will include repair of building walls and floors, repair and maintenance of electrical gadgets, painting and replacement of worn out materials among others.

2.5. Description of the project’s decommissioning activities

2.5.1. Demolition works

Upon decommissioning, the project components including buildings, pavements, drainage systems and associated facilities will be demolished. This will produce a lot of solid waste, which will be re-used for other construction works or if not re-usable, disposed of appropriately by a licensed waste disposal company.

2.5.2. Dismantling of equipment and fixtures

All equipment including electrical installations, furniture, finishing fixtures partitions, pipework and sinks among others will be dismantled and removed from the site on decommissioning of the project. Priority will be given to reuse of these equipment in other projects. This will be achieved through resale of the equipment to other building owners or contractors or donation of this equipment to schools, churches and charitable institutions.

2.5.3. Site restoration

Once all the waste resulting from demolition and dismantling works is removed from the site, the site will be restored through replenishment of the top soil and re-vegetation using indigenous plant species.
3. BASELINE ENVIRONMENTAL AND SOCIO-ECONOMIC INFORMATION

3.1. Introduction

The proposed site is in Karen area along Bogani East Road on a plot measuring 5 acres. It is slightly slopy towards CUEA with an unoccupied bungalow and it is well served with utilities such as electricity and access roads. The site is approximately 6 minutes’ walk to Catholic University of East Africa.

3.2. Physical environment

3.2.1. Climatic Conditions

The climate in Nairobi is warm and temperate. There is a great deal of rainfall in Nairobi, even in the driest month. This climate is considered to be Cfb according to the Köppen-Geiger climate classification. The temperature here averages 18.8°C. In a year, the average rainfall is 962 mm. The average annual temperatures of the area range from 18 to 20°C, with average minima and maxima of 12–14 and 24 – 26°C, respectively. The warmest period occurs from January to March. Average potential evaporation is between 1,550 and 2,200 mm per year.

3.2.2. Average Daily Temperatures

The average daily temperature throughout the year varies slightly from month to month with average temperatures of around 17°C during the months of July and August to about 20°C in March. But, the daily range is much higher, with the differences between maximum and minimum temperatures each day around 10°C in May and up to 15°C in February. Between the months of June to September, southeast winds prevail in the coastal parts of Kenya and last up to several days without a break. The clouds cause day temperatures to remain low and most times the maximum temperature stay below 18°C. The minimum temperatures also remain low during cloudy nights, usually hovering around 8°C and sometimes even reaching 6°C. Clear skies in January and February also bring colder nights. The highest temperature ever reached in Nairobi was 32.8°C and the lowest was 3.9°C.

3.2.3. Average Humidity Values

Because of the area’s location just south of the equator in combination with humid air pumped in from the Indian Ocean, the humidity values for each day are generally on the higher end. This is not to say that values are always high, since the easterly winds coming off the Indian Ocean tend to keep the temperatures standard throughout the country; therefore the “warm sticky” feeling is usually not associated with Nairobi as much as one would think. In the summer to autumn months of January to April, relative humidity values have been known to plummet to anywhere from 10% to 20%. The typical day, humidity-wise, starts off with nearly saturated in the morning hours, and steadily decreases throughout the remainder of the day.
3.2.4. Average Rainfall

With these routinely high relative humidity figures, it is not surprising that the Nairobi climate is one that produces much rain annually. In fact, from the past 50 years, the expected amount of rain could be anywhere in the range of 500 to 1500 mm, with the average ringing in at 900 mm. The majority of these rainfall figures crash down in Nairobi in one major and one minor monsoon seasons respectively. The major monsoon season occurs within the months of March to May, and is called the “Long Rains” by the locals. The minor monsoon seasons emerges within the October to December Months, and is called the “Short Rains”. That is what the meteorologists as a whole know about the monsoon seasons. What they do not know is exactly when these seasons will start. There is usually not an indication of when these rainy seasons will start, since it is difficult to determine when one starts and when the other finishes. Consequently, one may think there is only one rainy season when looking at the annual rainfall amounts.

3.3.5. Average Winds

Winds along the surface are predominantly easterly throughout the entire year. They are shifted to northeast between October and April and they are shifted southeast between May and September. Right before the “Long Rains” season, the strongest winds occur, reaching speeds of 20 to 25 miles per hour. During the rest of the year, winds are usually at speeds of 10 to 15 miles per hour. During the night, the winds are calm.

3.3.6. Average Sunshine

Early mornings in the area are often cloudy, but the sun peeks through by mid-morning. Throughout the year, there is an average of seven hours of sunshine per day. Thirty percent more sunlight reaches the ground during the afternoon than in the morning. Of course, there is more sunshine during the summer months, when the sun is more overhead in the southern hemisphere. Infrequently during the rainy season the sun never show through the clouds. Even in August, the cloudiest month, there is an average of four hours of sunshine.

3.3.7. Infrastructure

The proposed site is along Bogani road. Generally, it is served through access roads linked to Ngong and Langata roads as well as the southern bypass roads. This will be convenient for ferrying of supplies to the site during construction. The area is an educational hub within a walking distance to several universities hence will reduce the students need to commute to and from the campus. In general, Nairobi city and nearby satellite towns are well served with good communication and transport network such as air, road, and railway. It is centrally located to serve the Eastern African Countries. Bus and train stations are within an easy walk of the City Centre. The main Railway line runs from Mombasa through Nairobi to Malaba. The Network facilitates transportation of agricultural products from Western Kenya to the Coast. The city is a hub of road transport connecting other major towns in the country. On air transport Jomo Kenyatta International Airport makes it easy to transport goods from all over the world into the country and vice versa.
3.3. Socio-economic environment

3.3.1. Population

Nairobi County had a population of 3.14 million people being the most populous county in Kenya. The human development index for Nairobi was 0.64\(^1\) which is above the national average. This goes to show that the county in which the project is located has achieved above average development in health, education and income. The project will target university student population in nearby institutions described in the table below.

3.3.2. Land use

Nairobi County has had a marked change in land use over the years. For example a study by (K'Akumu and Onyango 2007) revealed that the area of the city under urban built-up, open and transitional land cover have increased from 73.08 km\(^2\) in the year 1988 to 228.65 km\(^2\) in the year 2015. While agricultural, grass, secondary growth and riparian vegetation which occupied 126.82 km\(^2\) of the city in the year 1988 have marginally increased to 189.73 km\(^2\) in the year 2015; forest cover have shown mixed gains and loss. In the year 1988, the area of the city under the forest cover was 59.63 km\(^2\) (K'Akumu and Onyango 2007).

This increased to 122.41 km\(^2\) in the year 1995 and thereafter declined by approximately 50% reaching 63.63 km\(^2\) in the year 2000. The decline is attributed to the indiscriminate extraction of forest resources and clearance of the same for urban developments which characterized the periods between the years 1995 to 2002. This situation was reversed in the year 2003 when the new government re-emphasized and re-energized strategies geared towards increasing the forest cover in the country. Such strategies included the degazettement and clearance of illegal structures within the forest reserves. This has since made the area of the city under forest cover to gradually increase from 63.63 km\(^2\) in the year 2000 to 93.44 km\(^2\) in the year 2015 (K'Akumu and Onyango 2007).

3.4. Biological environment

The nearest site that is rich in biological diversity is the Nairobi National Park. It was established in 1945. The park’s predominant environment is open grass plain with scattered Acacia bushes. scattered acacia bush play host to a wide variety of wildlife including the endangered black rhino, lions, leopards, cheetahs, hyenas, buffaloes, giraffes and diverse

---

\(^1\) https://data.humdata.org/dataset/dbd26b22-99a1-be5g-17b0305828ae2/resource/b46703cc-196f-4e40-8806-e1dd1709d81c/download/kenya-human-development-index-hdi-near-county.xls - Accessed 29th August 2019
birdlife with over 400 species recorded. Visitors can enjoy the park’s picnic sites, three campsites and the walking trails for hikers.
4. LEGISLATIVE AND REGULATORY FRAMEWORK

4.1. Constitutional and Legal Framework

Article 42-Environment: Indicates that every person has the right to a clean and healthy environment, which includes the right to:
- Have the environment protected for the benefits of present, future generations through legislative and other measures, particularly those contemplated in Article 69, and
- Have obligations relating to the environment fulfilled under Article 70. *(2)*

Article 43-Economic and social Rights
Indicate that every person has the right to accessible and adequate housing and to reasonable standards of sanitation.

4.1.2. The Environmental Management and Coordination Act chapter 387

The Environmental Management and Coordination Act (EMCA) chapter 387, and its Attendant Environmental (Impact Assessment and Audit) Regulations of 2003 provides for the establishment of an appropriate legal and institutional framework for the management of environment in Kenya. The Act introduces two important aspects of urban environmental management, which are directly related to the proposed project: environmental impact assessment (EIA) and environmental audit (EA).

Section 58 (1) has underscored that any person being a proponent of a project Shall before financing, commencing or proceeding with submit an EIA report to the National Environmental Management Authority (NEMA) of Kenya.(3)

Section 68 (1) gives NEMA the mandate for carrying out all environmental audits of all activities that are likely to have significant impacts on the environment. It authorizes environmental inspectors, as appointed by NEMA to enter in any premise and determine how far the activities carried out conform to statements in EIA study.

Compliance with EMCA
- The proponent has undertaken an EIA as per the requirements of Section 58 (1) of EMCA chapter 387 awaiting approval prior to the commencement of the project.
- The proponent will implement the proposed EMP and adhere to the conditions set in the license of the proposed project.
- The proponent will adhere to subsequent EMCA legislations such as the noise and waste regulations throughout the cycle of the project.
- The proponent shall undertake Environmental audits for the project and submit the reports to NEMA as per the EIA/EA guidelines.

---

26 | Page
4.1.3. Physical Planning and Land Use Planning Act, 2019

An ACT of Parliament to make provision for the planning, use, regulation and development of land and for connected purposes.

Section 57 (1) A person shall not carry out development within a county without a development permission granted by the respective county executive committee member.
(2) A person who commences any development without obtaining development permission commits an offence and is liable on conviction to a fine not exceeding five hundred thousand shillings or to imprisonment for a term not exceeding two months or to both.
(3) A county executive committee member shall require a person who has commenced a development without obtaining development permission to restore the land on which the development is taking place to its original condition or as near to its original condition as is possible and that such restoration shall take place within ninety days.

Section 59 (1) A person applying for development permission shall ensure that any documents, plans and particulars that are provided to the respective county executive committee member while applying for development permission have been prepared by the relevant qualified, registered and licensed professionals.

Section 65 A county executive committee member may impose conditions or impose a fine to be prescribed in regulations on an applicant for development permission for building works where that applicant fails to complete the building works within five years.

According to the Third Schedule Development Control,

Section 4. Planning authorities shall require applications for major developments to be subjected to environmental and social impact assessment.

Compliance with this legislation

- The architectural plans of the proposed development have been submitted to the county government of Nairobi for approval upon which the project shall commence.
- The proposed project has been subjected to the requisite ESIA and report submitted to NEMA for licensing to acquire the EIA license.
- The proponent will ensure that the land is utilized in an eco-friendly manner and is restored to its original condition once the project is decommissioned.
- Ensure the development does not in any way have injurious impact on the environment and that a developmental footprint of less than 50% is maintained.

4.1.4. Physical Planning (Building and Development Control) Regulations

Under the provisions of the Physical Planning (Building and Development control) Regulations; The Director of Physical Planning shall refuse to recommend any new building or proposed development, or alteration or addition to any existing building if:

i. The proposal is not in conformity with approved development plan.
ii. Such plans disclose a contravention of the physical Planning (Building and Development) rules.
iii. The plans are not correctly drawn or omit to show information required.
iv. On such being required, separate application accompanied by sets of plans has not been lodged in respect of building on separate plots or subplots etc.
Compliance
- Change of use to mixed use (student hostels, convenience shops and restaurant) has been approved by the county government (see attached change of use certificate)
- The proponent shall adhere to the recommendations given in the building order by the county physical planner
- The proponent shall ensure that the building plans are available on site for inspection by county officials during construction and at any other time.

4.1.5. The Public Health Act (Cap 242)

Section 15 (ix) – Nuisance
Any noxious matter or wastewater discharged from any premises, such as a building constitutes nuisance. Any premise not kept in a clean and free from offensive smell such as gases which are injurious to health such as those from commercial establishments shall therefore generate nuisance. The Act therefore stresses that no person shall cause a nuisance to exist on any land or premise occupied by him.

The Act acknowledge that it shall be the duty of all local authorities to take all lawful measures for maintaining its district at all times in a clean and sanitary condition for remedy of any nuisance or condition liable to be injurious to health. To safeguard against this, part X of the public Health Act states that where in the opinion of the Medical Officer of Health that food stuffs within a warehouse, or a building are insufficiently protected, the owner shall be compelled to observe the require regulations, else he shall be guilty of an offense.4

Compliance
- The proponent will ensure solid waste shall be handled by a professional NEMA approved garbage collector on regular basis and disposed appropriately as per the waste regulations.
- Sanitary facilities shall be in conformity with MOH standards and installation of standard fittings. Liquid wastes shall be contained in a waste treatment plant and an EDL applied within the first year of operation.

The purpose of this Act is to secure the safety, health and welfare of persons at work, and protect persons other than persons at work against risks to safety and health arising out of, or in connection with, the activities of persons at work. It applies to all workplaces where any person is at work, whether temporarily or permanently. Failure to comply with the OSHA, 2007 attracts penalties of up to KES 300,000 or 3 months jail term or both or penalties of KES 1,000,000 or 12 months jail term or both for cases where death occurs and is in consequence of the employer

---

Compliance

- The proponent will appoint a reputable contractor who will be responsible for enforcing the requirements during construction and subsequent repairs and maintenance after project completion.
- They will make provision for the health, safety and welfare of persons employed in factories and other places of work. Ensure that every work place shall be kept in a clean state and free from effluvia, arising from any drain, sanitary convenience or nuisance.
- Avail fire extinguishers, which shall be adequate and suitable in case of fire outbreaks. Provide adequate means of escape in case of fire outbreak for the employees.
- Provide suitable protective clothing must be provided.

4.1.7. National Building Regulations, 2017

The National Building Regulations (NBR) 2015 is a set of rules to be used by professionals in the building industry to guide design, construction and maintenance of buildings in Kenya. The review was necessitated by the frequent disasters that have befallen the country in the recent past and the generally decaying built environment. The NBR 2015 effectively replaces the outdated 1968 Building Code which has been in use since the colonial era. The 1968 Building Code had many shortcomings and could not adequately address the needs of a safer, secure, healthier, attractive and well maintained built environment. It remained static and failed to move in tandem with the trends and shifts in building industry, such as emerging technologies and materials, green building and security intelligence. The NBR 2015 is informed by the Constitution of Kenya 2010, Vision 2030 and other relevant unfolding reviews such as the National Construction Act which seeks to register contractors in Kenya.

Section A - 5 Development Permissions; A - 5.1 No person shall develop or cause to be developed any building on land where development permissions applicable to the area have not been granted.
A - 5.2 Any person who contravenes the provisions of these Regulations shall be guilty of an offence.

Section 27 Construction

All workmanship in the erection of any building shall be in accordance with sound planning and building practice. Any building, including any structural element or component thereof, shall be constructed so as to comply with the design requirements of these Regulations.

Precautions shall be taken during all stages of construction or any building to ensure that the structural system is not damaged or distorted during the course or erection of such building.

Section A - 33 Certificates of Occupation
A - 33.1 On completion of any building works, the person for whom the building works were carried out shall apply to the approving authority for:-
(a) a full Occupation Certificate; or
(b) a Sectional Completion Certificate
(c) a Temporary Occupation permit.
A - 34.5; Protection of Persons and Property
Throughout the progress of any work to which these Regulations apply, every person responsible for the erection of a building, shall ensure by suitable means the safety and protection of all persons and property liable to be affected by the work.

Compliance
- The proponent should ensure that the regulations as guided by various approving and licensing authorities are adhered to strictly.
- The project proponent has submitted the building plans and the required information to the approving authority (County government of Nairobi) for requisite approval before commencement of the work and regular monitoring will follow to ensure compliance with set standards and conditions.
- The proponent should ensure that any persons affected by the project’s activities are protected from all harm and that all hoarding of the site is made to prevent unauthorized entry.
- The proponent will obtain Certificate of Completion on decommissioning. They shall further provide firefighting equipment that may include one or more of the following: hydrants, hose reels and fire appliances, portable fire appliances, water storage tanks and dry risers.

4.1.8. Penal Code (Cap. 63)

The chapter on “Offences against Health and Conveniences” strictly prohibits the release of foul air into the environment, which affects the health of other persons. Any person who voluntarily violates the atmosphere at any place, to make it noxious to health of persons in general dwelling or carrying out business in the neighborhood or passing along public ways is guilty of misdemeanor, i.e. imprisonment not exceeding two years with no option of fine. Under this Act, any person who for the purpose of trade or otherwise makes loud noise or offensive awful smell in such places and circumstances as to annoy any considerable number of persons in the exercise of their rights, commits an offence, and is liable to be punished for a common nuisance, i.e. imprisonment not exceeding one year with no option of fine.

Compliance

The proponent is advised to ensure, using appropriate technology, that foul air which affects the health of other persons will not be released into the environment. Furthermore there are advised to ensure that there is no loud noise or offensive awful smell in such places and circumstances that may annoy any considerable number of persons in the exercise of their rights.

4.1.9. Water Quality Regulations, 2006

The law is based upon the principle that everybody is entitled to a healthy and clean environment. Section 42, is pertinent to the implementation of this project. These Regulations shall apply to drinking water, water used for industrial purposes, water used for agricultural purposes, water used for recreational purposes, water used for fisheries and wildlife, and water used for any other purposes5.

Compliance with this legislation

- Since the area is not served by the municipal sewer line, there is provision for connection to the proposed waste water treatment plant
- The proponent is advised to apply for an effluent discharge license (EDL) as required by these regulations.

4.1.10. Noise and Excessive Vibrations Pollution (Control) Regulations

Part II of the regulations\(^6\) regulations; section 3 states:

1. Except as otherwise provided in these Regulations, no person shall make or cause to be made any loud, unreasonable, unnecessary or unusual noise which annoys, disturbs, injures or endangers the comfort, repose, health or safety of others and the environment.

Compliance: The proponent shall take into concern the provisions of the local authority act to ensure that the development complies with the provisions of the Act.

This legislation gives guidelines for handling different kinds of waste. Some of the relevant sections to the proposed project are as follows:

Part II Section 1: No person shall dispose of any waste on a public highway, street, road, recreational area or in any public place except in a designated waste receptacle

Part II Section 6: Any person who owns or controls a facility or premises which generates waste shall minimize the waste generated by adopting the following cleaner production principles:

a) Improvement of production process through:
   i. Conserving raw materials and energy
   ii. Eliminating the use of toxic raw materials within such time as may be prescribed by the Authority
   iii. Reducing toxic emissions and wastes

b) Monitoring the product cycle from beginning to end by:
   i. Identifying and eliminating potential negative impacts of the product.
   ii. Enabling the recovery and re-use of the product where possible.
   iii. Reclamation and recycling.

c) Incorporating environmental concerns in the design, process and disposal of a product\(^7\).

Compliance

- The proponent will ensure that all waste are segregated before being transported to a designated waste treatment facility by a contracted NEMA licensed waste transporter
- A contracted waste handler licensed by NEMA will be responsible for safe disposal of solid wastes from the residences

---

4.1.12. The National HIV Policy

The HIV policy is geared towards ensuring that new development projects encourage preventive and responsible behaviour both for the workers involved in such projects and the local people within which projects are taking place as a goal towards curtailing the spread of the disease. The proponent is advised to put in place adequate measures so as to ensure that implementation of the proposed projects does not heighten the spreads of HIV and AIDS.

4.2. Institutional Framework

The environmental impact assessment for the proposed development is influenced by interest of several stakeholders and lead agencies, either exclusively or concurrently. Some of these stakeholders and lead agencies include:

- National Environmental Management Authority (NEMA)
- Director of Physical Planning
- The County Government of Nairobi
- The Ministry of Education
- The ministry of Environment and Natural resources

4.3. Development Policy Framework

The overall development policy framework for the proposed project is captured in various local authority and government documents. The development of this project has been benchmarked against UN and International guidelines.

4.3.1. The World Commission on Environment and Development

The commission commonly referred to as “the Brundtland Commission” is focused on the environmental aspects of development. Economic sustainable development is development for which progress towards environmental and social sustainability occurs within available financial resources. Social sustainable development maintains the cohesion of a society and its ability to help its members work together to achieve common goals, while at the same time meeting individual needs for health and wellbeing, adequate nutrition, shelter, cultural expression, and political involvement.\(^8\)

4.3.2. The Rio Declaration on Environment and Development

The Rio Declaration on Environment and Development was adopted by more than 178 governments at the United Nation Conference on Environment and Development, known as the earth summit, held in Rio de Janeiro, Brazil from 3rd to 14th June 1992. Under Agenda 21, Principle No. 10 of the declaration underscores that environmental. Issues are best handled with participation of all concerned citizens at all relevant levels. At the national level, each individual shall have appropriate access to information concerning environment that is held by public authorities. States shall encourage and facilitate public participation by making information widely available. Effective access to judicial and administrative proceedings, including redress and remedy shall be provided.

---

The foregoing discussion is relevant to the proposed development because Kenya legislation demands that public must be involved before any development project that is likely to have adverse impacts to the environment is initiated by a project proponent. The environment Act has further established public complaints committee (PCC) where the issues raised by the public in regard to any proposed development can be addressed⁹.

4.3.3. Kenya Vision 2030

Kenya aims to be a nation that has a clean, secure and sustainable environment by 2030. The goals for 2030 are: (i) to increase forest cover from less than 3% at present to 4%; and (ii) to lessen by half all environment-related diseases. Specific strategies will involve promoting environmental conservation in order to provide better support to the economic pillar flagship projects and for the purposes of achieving the sustainable Development Goals (SDGs); improving pollution and waste management through the design and application of economic incentives; and the commissioning of public-private partnerships (PPPs) for improved efficiency in water and sanitation delivery. Kenya will also enhance disaster preparedness in all disaster-prone areas and improve the capacity for adaptation to global climatic change. In addition, the country will harmonize environment-related laws for better environmental planning and governance¹⁰.

4.3.4. Sustainable Development Goals (SDGs)

Kenya ratified the sustainable development goals in August 2015. The 2030 Agenda for Sustainable Development, adopted by all United Nations Member States in 2015, provides a shared blueprint for peace and prosperity for people and the planet, now and into the future. At its heart are the 17 Sustainable Development Goals (SDGs), which are an urgent call for action by all countries - developed and developing - in a global partnership. They recognize that ending poverty and other deprivations must go hand-in-hand with strategies that improve health and education, reduce inequality, and spur economic growth - all while tackling climate change and working to preserve our oceans and forests.

The proposed project will be guided by targets and indicators espoused in the following sustainable development goals. Whereas the time frame for achieving the SDGs has been set for year 2030, achievement for certain targets for the current project will be immediately during construction and occupation.

- SDG 4 – Quality Education. The project will enable achievement of this goal through provision of quality and affordable student residencies.
- SDG 6 – clean water and sanitation. The proponent will be required to provide clean drinking water for workers during construction and students during operational phase.
- SDG 10 – Reduced inequality. Equal opportunity for employment across gender must be given throughout the project cycle.
- SDG 11 – Sustainable cities. The development offers opportunities to achieve this goal. Construction of multistoried buildings it is possible to reduce both the direct

---

and indirect demand of built-up and bio productive areas correspondingly. Onsite treatment of waste water from the residencies will further enhance sustainable use of land and water resources.

- SDG 13 – Climate action. Incorporating solar PV for street lighting will reduce grid emissions thereby mitigating against climate change.
5. PUBLIC PARTICIPATION

5.1. Objectives of the consultation and public participation

The objective of the Consultation and Public Participation (CPP) as required in EMCA chapter 387 was to:-

1. Disseminate and inform the public and other stakeholders about the proposed project with special reference to its key components, location and expected impacts.
2. Create awareness among the public on the need for the EIA for the proposed project.
3. Gather comments, concerns and suggestions of the interested and, would be affected/interested parties.
4. Ensure that the concerns of the interested and, would be affected/interested parties were known to the decision-making bodies and the proponent at an early phase of project development planning.
5. Establish a communication channel between the interested, would be affected/interested parties, the team of consultants and the Government.
6. Incorporate the information collected in the project by EIA Experts.

The purpose for such a process was to identify the positive and negative impacts of the project and subsequently suggest mitigation measures.

5.2. Methodology used in the CPP

The Consultation and Public Participation (CPP) Process is a policy requirement by the Government of Kenya and a mandatory procedure as stipulated by EMCA Cap 387 section 58, on Environmental Impact Assessment for the purpose of achieving the fundamental principles of sustainable development\textsuperscript{11}.

Preliminary interviews showed that there were no objections to the incoming development as shown by the level of approval the proposed project has garnered. The development is also not alien to the area since there are established institutions (Table 2 above) in the area. However, to comprehensively address issues that may emerge during construction and occupation, the consultant and the proponent are conducting further consultations as guided by NEMA regulations on PP during Covid – 19 era. Emerging issues shall be submitted to the authority as an addendum to this report.

In view of the ongoing pandemic and government guidelines issued, public consultation shall be through the following methods:

- A public forum – members of the public shall be invited to a public forum possibly via zoom or any other media platform. This will be directed by the licensing authority.
- Printed questionnaires – open ended questionnaires shall be handed out to people in the neighbourhood.
- Electronic questionnaires - the open ended questionnaire shall also be posted on the consultant’s website. When handing over the printed questionnaire, respondents will

be directed to a link to the electronic questionnaire thus will have more options to respond while keeping the recommended social distance

- Posters – posters shall be erected in the project site neighbourhood to inform affected persons about the upcoming project. an email address shall be provided for sending comments
- Media – There will be two advertisements in a national newspaper, one radio advertisement and one Kenya Gazette advertisement as will be directed by the licensing authority. Members of the public will be able to respond to the Authority directly via an email address to be provided in the advertisements.

Information gathered from public consultation shall be collated and submitted to the authority as an addendum to this report.

5.3. Preliminary consultation

The proponent has already undertaken preliminary consultation for the proposed project. These consultations were mainly with administrative heads of academic institutions in the area. Institutions consulted were:

- Catholic university of east Africa
- Kenya School of Law (KSL)
- JKUAT Karen
- Co-operative University
- Tangaza university college
- Marist college
- Africa International University
- CORAT Africa
- Don Bosco Utume
- Multimedia University of Kenya

These institutions acknowledged the need for the proposed project as a solution to inadequate student residencies. Their comments are appended to this report.
6. POTENTIAL ENVIRONMENTAL IMPACTS

6.1. Positive Impacts during Construction

6.1.1. Employment Opportunities

One of the main positive impacts during projects construction phase is the availability of employment opportunities especially to casual workers and several other skilled workers such as building and construction engineers. Employment opportunities are of benefit both economically and socially.

Several workers including casual labourers, masons, carpenters, joiners, electricians, and plumbers are expected to work on the site during the construction phase. Apart from casual labour, semi-skilled, unskilled labour and formal employees are also expected to obtain gainful employment during the period of construction. Generally, employment during the construction phase will lead to multidimensional development in the area and in Nairobi at large and improve several people’s living standards.

6.1.2. Optimal Use of Land

In Africa the UN predicts that the current 400 million urban citizens will exceed 750 million by 2030 and will reach 1.2 billion by 2050. The increasing population will require adequate facilities at learning institutions that are mostly located in cities. It is also plausible to note that while urban population increases the size of land available for development will continue to decrease. The effect of this trend has been the reduction of farmland and encroachment into animal habitats and migration routes. Thus, it is highly recommended that land being a finite resource must be optimally utilized.

The proposed project will see conversion of idle land into student residence for the surrounding institutions. The residences will accommodate more than 3500 students at a property that initially had a single dwelling house housing one household. This type of land use in a city also makes it easier for provision of services such as waste management, piped water and electricity. It is reported that detached houses/dwellings have a larger ecological footprint than storied houses (Bastinoni, et al., 2006). Thus, through the construction of multistoried buildings it is possible to reduce both the direct and indirect demand of built-up and bio productive areas correspondingly.

6.1.3. Economic Growth

Through the use of locally available materials during the construction phase e.g. cement, concrete and ceramic tiles, timber, sand, ballast; electrical cables and others; the project will contribute towards growth of the country’s economy by contributing to the gross domestic product. The consumption of these materials, oil, fuel and others will attract taxes including VAT which will be payable to the government hence increasing government revenue while the cost of these raw materials will be payable directly to the producers.

---

6.1.4. Improvement of the Informal Sector

There are usually several informal businesses, which come up during the construction periods of such projects. These include food vendors who benefit directly from the construction workers buying food and other commodities from them. This will promote the informal sector in securing some temporary revenue and hence improve their livelihood.

6.1.5. Market for Supply of Building Materials

The project will require supply of large quantities of building materials most of which will be sourced locally in within Nairobi and the surrounding areas. This provides ready market for building material suppliers such as quarrying companies and hardware shops.

6.2. Negative Impacts during construction

6.2.1. Noise pollution

The construction works will most likely be a noisy operation due to the moving machines (mixers, tippers, communicating workers) and incoming vehicles to deliver construction materials and workers to the site. Workers are most likely to be affected since noise beyond some level is itself a nuisance if not maintained within acceptable levels.

6.2.2. Disposal of excavated soil

Site excavations shall be done to the satisfaction of the Principal Consultant’s specification hence some materials shall be rejected as waste for disposal. Improper disposal of this category of waste may have adverse impacts on the receiving environment.

6.2.3. Soil Erosion

The excavation and construction activities are likely to loosen the soil particles making them prone to soil erosion. Such problems become serious when the topsoil is left bare and agents of erosion become active. Construction also requires use of sand and other natural materials such as hardcore rocks and others used in cement manufacture which must be sourced from a different location. This leaves vast areas prone to erosion. Soil erosion is an important problem both at its source and downstream of the development site. Lost soil will be deposited somewhere, and the location of the deposition could alter downstream hydrology and increase chances of flooding. It may also pose a water quality issue directly as a result of siltation and indirectly from contaminants carried with or attached to soil particles.

6.2.4. Dust Emissions

Particulate matter pollution is likely to occur during the site clearance, demolitions, excavation and loading and transportation of the construction waste. There is a possibility of PM$_{10}$ suspended and settle-able particles affecting the site workers and even neighbours health.
6.2.5. Increased Water Demand

Both the workers and the construction works will create an increased demand for water in addition to the existing demand. Water will be mostly used in the creation of aggregates for construction works and for wetting surfaces for softening or hardening after creating the formworks.

6.2.6. Generation of Exhaust Emissions

Exhaust emissions are likely to be generated during the construction period by the various construction machinery and equipment. Motor vehicles used to mobilise the work force and materials for construction would cause a potentially significant air quality impact by emitting pollutants through gaseous exhaust emissions.

6.2.7. Building Materials and Energy Consumption

The main sources of energy that will be required for construction of the project will include mains electricity and fossil fuels (especially diesel). Electricity will be used for welding, metal cutting/grinding and provision of light. Diesel will run material transport vehicles and building equipment/machinery. The proponent should promote efficient use of building materials and energy through proper planning to reduce economic and environmental costs of construction activities.

6.2.8. Generation of solid wastes

During construction solid waste will be generated. These include papers used for packing cement, plastics and timber remains among others. Dumping around the site will interfere with the aesthetic status of the area. This has a direct effect to the surrounding community. Disposal of the same solid wastes off-site could also be a social inconvenience if done in the wrong places. The off-site effects could be aesthetic, pest breeding, pollution of physical environment, invasion of scavengers and informal recycling communities.

6.2.9. Risk of accidents

During construction, it is expected that workers are likely to have accidental injuries as a result of accidental occurrences, handling hazardous waste, lack or neglect of the use of protective gear etc. All necessary health and safety guidelines should be adhered to so as to avoid such circumstances.

Workers are also likely to be exposed to diseases from contact with potentially harmful building materials. It is therefore recommended that before the construction activities, materials should be thoroughly inspected and harmonised to the occupational health and safety standards.

6.2.10. Oil spills

The machines on site may be containing moving parts which will require continuous oiling to minimise the usual corrosion or wear and tear. Possibilities of such oils spilling and contaminating the soil and water on site are real. Likewise, moving vehicles on site may
require oil change. But these dangers are curbed by maintaining the machinery in specific areas designed for this purpose.

6.2.11. Increased energy consumption

The project will consume fossil fuels (mainly diesel) to run transport vehicles and construction machinery. Fossil fuel is non-renewable and its excessive use may have serious environmental implications on its availability, price and sustainability. The project will use electricity supplied by KPLC for construction and operation. Electricity in Kenya is generated mainly through natural resources, namely, water and geothermal resources. Approximately 32% of electricity in Kenya is generated from thermal sources\textsuperscript{13}. Thus it should be prudently used e.g. by installing occupational sensing lights and use of energy saving bulbs. The buildings will be IFC Edge compliant with applications that can support the environmental aspect of the project including low flow taps and LED lighting. Such initiatives will lower grid emissions and the overall project carbon footprint.

6.3. Positive Impacts during Occupation Phase

6.3.1. Increased student enrolment due to accommodation availability

Increased enrolment in universities over the past decade has subsequently augmented demand for accommodation. Most universities if not all in Kenya do not have adequate facilities for the increasing numbers. Shortage of accommodation facilities in public and private universities is forcing students to live in residencies outside the campuses, exposing them to insecurity. A government scheme to encourage the private sector to put up residencies near universities has not met the demand for accommodation, leaving most students at the mercy of unscrupulous landlords and criminals\textsuperscript{14}. University enrolment has for a long time been curtailed by the lack of student accommodation. At times, the expensive accommodation available makes the cost of higher education unaffordable to the majority of people.

The proponent has been working to meet the high demand for student accommodation facilities. Their model seeks to not only provide accommodation but to do it the right way. This model includes providing among others comfortable, secure, standard, affordable residencies. The initiative will give parents some form of relief knowing that their children are living in secure environments as they study. The proposed project will add more than 3500 more accommodation units for at least seven institutions in the project area (refer to Table 2 above) but this will not be sufficient in meeting the demand in the area.

6.5.2. Employment Opportunities

Employment opportunities are one of the long term impacts of the proposed project that will be realised after construction and during the operation and maintenance of the building. These will involve other sources of employment of many skilled and semi-skilled people to work in the proposed commercial building.

\textsuperscript{13} https://energypedia.info/wiki/Kenya_Energy_Situation - Accessed 4th September 2019
-Accessed 3rd June 2020
6.3.3. Incorporation of proper Waste Management System

The project is designed such that there will be provision of a well-planned strategic waste management system. The wastes will thus be collected from the site in bulk and as one unit such that the careless disposal leading to proliferation of wastes within the surrounding areas will be curbed.

6.3.4. Increased Revenue generation

Revenues paid to the national and county government in form of taxes will increase once the project is complete. The value of the plot will increase leading to increased land rates payable to the County government.

6.3.5. Improving growth of the Economy

Through the use of locally available materials during the construction phase of the project including cement, concrete and ceramic tiles, timber, sand, ballast electrical cables etc. the project will contribute towards growth of the economy by contributing to the gross domestic product. The students will be in constant need of basic needs hence ready market for foodstuffs and stationary among others.

6.3.4. Increased Business Opportunities

The large number of project staff required will provide ready market for various goods and services, leading to several business opportunities for small-scale traders such as food vendors around the construction site. The project management will wish to reside in the neighborhood hence increased demand for accommodation and other resources.

6.3.5. Provision of retail space and business facilities

The proposed project once complete will offer several retail spaces and business facilities to people thus improving the living standards for the same. The retail outlet will not only provide employment to residents and the students but will be a source of goods and services within reach.

6.4.6. Reduction of Traffic and increased Security within Karen Area

Majority of the student population live in and around the Ngong and Rongai town areas, hence the need to commute daily to school. This poses a security risk for the students as they do so everyday especially for those with who have evening classes and the risk of commuting with laptops which are essential for their learning. With the increase in commuting time, students are be subjected to higher commuting costs as they subject the Karen area residents to increased traffic and proliferation of matatus. The proposed student residents will curb this as the students will all be within walking distance to their respective campuses.
6.4. Negative Impacts during operation

6.4.1. Increased Pressure on Infrastructure

During construction there shall be increased use of these roads to ferry material and equipment. Further pressure will be experienced during occupational phase albeit to a lesser extent since vehicle movement into the facilities shall be restricted to the parking slots available. Furthermore, the proponent shall provide bus transportation to the students.

6.4.2. Water use

Domestic consumption of water during the operation phase of the project will involve the use of large quantities of water that will take place due to the increased number of households in the area. A hydrogeological survey had been carried out to ascertain that there will be sufficient ground water for all neighbours using boreholes within the area.

6.4.3. Solid Waste Generation

It is envisaged that substantial amounts of solid wastes will be generated from the proposed development once it is complete. The bulk of the solid waste produced during the operation of the project will entail paper, plastic, glass, metal, textile and organic wastes. Such wastes can be harmful to the environment through obstruction of drainage systems, clogging of water bodies and negative impacts on animal health. Some of these waste materials especially the plastic/polythene are not biodegradable hence may cause long-term effects to the environment. Even the biodegradable ones such as organic wastes may be harmful to the environment because as they decompose, they produce methane gas, a greenhouse gas known to have a high warming potential.

6.4.4. Increased storm water flow

The building roofs and pavements will lead to increased volume and velocity of storm water or run-off flowing across the area covered by the units. This will lead to increased amounts of storm water entering the drainage systems, resulting in overflow and damage to such systems in addition to increased erosion or water logging in the Neighbouring areas.

6.5. Positive Impacts during decommissioning

6.5.1. Rehabilitation

Upon decommissioning of the proposed project, rehabilitation of the project site will be carried out to restore the site to its original status or to a better state than it was originally. This will include replacement of topsoil and re-vegetation, which will lead to improved visual quality of the area.

6.5.2. Employment Opportunities

Employment opportunities will be created for the demolition staff during the demolition phase of the proposed project.
6.6. Negative Impacts during decommissioning

6.6.1. Noise and Vibration

The demolition works will lead to significant deterioration of the acoustic environment within the project site and the surrounding areas. This will be because of the noise and vibration that will be experienced as a result of demolishing the proposed project.

6.6.2. Generation of Solid Waste

Demolition works will result in large quantities of solid waste. The waste will contain the materials used in construction including concrete, metal, drywall, wood, glass, paints, adhesives, sealants and fasteners. Although demolition waste is generally considered as less harmful to the environment since they are composed of inert materials, there is growing evidence that large quantities of such waste may lead to release of certain hazardous chemicals into the environment.

6.6.3. Increased dust emission

Large quantities of dust will be generated during demolition works. This will affect demolition workers as well as the neighbors and plants in the area.

6.6.4. Loss of all occupational phase benefits

Decommissioning of the project will result in loss of all the positive impacts accrued during occupation of the residencies. These impacts have been discussed in section 6.3 above.

6.7. Climate change impacts

The proposed project construction and operational activities will have an impact on climate change. It is important to study the climate impacts of construction, operation and decommissioning phases. Such studies will guide project proponents and policy makers in allocating resources for mitigation. Here we only highlight the foreseen impacts but a detailed life cycle analysis of the project will give a clearer data and results.

The project's impact on climate will largely depend on energy consumption, material extraction, water use and waste water treatment, food waste and other wastes generated, type of solid waste treatment among others. Consumption of fossil fuels to power machinery and vehicles will lead to direct emission of greenhouse gases (GHGs) to the atmosphere. Anaerobic and aerobic treatment of waste water will generate methane - a potent GHG with a global warming potential that is 28-36 times that of carbon dioxide. If methane is not recovered from the process its impact to climate will be significant.

Another source of methane will be decomposition of food waste in landfills and waste treatment sites. About 11% of all the greenhouse gas emissions that come from the food system could be reduced if we stop wasting food\footnote{https://www.worldwildlife.org/stories/fight-climate-change-by-preventing-food-waste - Accessed 5th September 2019}. When we waste food, we also waste all the energy and water it takes to grow, harvest, transport, and package it. And if food goes to
the landfill and rots, it produces methane. Thus, it will be important to advise incoming occupiers of the residencies to reduce food waste and or donate leftovers.

The project will also be impacted by climate change. These impacts include increased surface temperatures and excessive rainfall. Increased surface temperatures occasioned by positive radiative forcing associated with anthropogenic GHGs may make it uncomfortable for construction workers. Additionally, high surface temperatures may increase room temperature in the residencies making it uncomfortable for students. Some students may resort to using air conditioning at these times thus increasing electricity demand and associated grid emissions. On the other hand, excessive rainfall may cause flooding within the compound as well as increase surface runoff that may damage infrastructure e.g. roads.

It is important that climate change impact mitigation measures are incorporated into the project design.
7. MITIGATION MEASURES AND MONITORING PROGRAMMES

7.1. Mitigation of Construction Related Impacts

7.1.1. Air Quality

Controlling dust during construction is useful in minimizing nuisance conditions. It is recommended that a standard set of feasible dust control measures be implemented for all construction activities. Emissions of other contaminants (greenhouse gases, and diesel related particulate matter) that would occur in the exhaust from heavy equipment are also included. The proponent is committed to implementing measures that shall reduce air quality impacts associated with construction.

All personnel working on the project will be trained prior to starting construction on methods for minimizing air quality impacts during construction. This means that construction workers will be trained regarding the minimization of emissions during construction. Specific training will be focused on minimizing dust and exhaust gas emissions from heavy construction vehicles. Construction vehicles drivers will be under strict instructions to minimize unnecessary trips and minimize idling of engines.

Dust emissions will be controlled by the following measures:

- Watering all active construction areas as and when necessary to lay dust.
- Cover all trucks hauling soil, sand and other loose materials or require all trucks to maintain at least two feet of freeboard.
- Pave, apply water when necessary, or apply (non-toxic) soil stabilizers on all unpaved access roads, parking areas and staging areas at construction sites.
- Sweep daily (with physical sweepers) all paved access roads, parking areas and staging areas at construction sites.
- Cover construction site with hessian cloth/ scaffolding netting to contain the dust within the premises and plant trees around the site upon construction completion.

7.1.2. Minimize the Effects of Noise Emitted from the Site

Significance of noise impacts depends on whether the project would increase noise levels above the existing ambient levels by introducing new sources of noise. Noise impacts would be considered significant if the project would result in the following:

a) Exposure of persons to, or generation of, noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.

b) Exposure of persons to, or generation of, excessive ground-borne vibration or ground-borne noise levels.

c) A substantial permanent increase in ambient noise levels (more than five decibels) in the project vicinity above levels existing without the project.

d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project.

The proponents shall put in place several measures that will mitigate noise pollution arising during the construction phase. The following noise-suppression techniques will be employed to minimise the impact of temporary construction noise at the project site.

- Install portable barriers to shield compressors and other small stationary equipment where necessary.
- Establishment of noise buffer.
• Use quiet equipment (i.e. equipment designed with noise control elements).
• Co-ordinate with relevant agencies regarding all substation construction activities in the residential areas.
• Install sound barriers for pile driving activity.
• Limit pickup trucks and other small equipment to a minimum idling time and observe a common-sense approach to vehicle use, and encourage workers to shut off vehicle engines whenever possible.
• Construction/Demolition works should be done during the day when people are away and also the outside environment is also noisy.
• Adhere to the provisions of Noise Prevention and Control Rules 2005, Legal notice no. 24 regarding noise limits at the workplace.

7.1.3. Minimise the Effects of Exhaust Emission

In order to control exhaust emissions the following measures shall be implemented during construction:
  a) Vehicle idling time shall be minimized
  b) Alternatively fuelled construction equipment shall be used where feasible
  c) Equipment shall be properly tuned and maintained
This will also be achieved through proper planning of transportation of materials to ensure that vehicle fills are increased in order to reduce the number of trips done or the number of vehicles on the road.

7.1.4. Hydrology and Water Quality Degradation

Soil sampling and trial holes digging will be conducted before construction begins and soil information will be provided to construction crews to inform them about soil conditions and potential hazards. If hazardous substances are unexpectedly encountered during trenching, work will be stopped until the material is properly characterised and appropriate measures are taken to protect human health and the environment. If excavation of hazardous materials is required, they will be handled in accordance with applicable regulations. If suspected contaminated groundwater is encountered in the depths of the proposed construction areas, samples will be collected and submitted for laboratory analysis of petroleum hydrocarbons, metals, volatile organic compounds and semi volatile organic compounds. Appropriate personal protective equipment will be used and waste management will be done in accordance with applicable regulations. Oil absorbent material and storage drums will be used to contain and control any minor releases of engine and other equipment oil.

7.1.5. Worker Accidents and Hazards when Handling Hazardous Wastes

Adequate collection and storage of waste on site and safe transportation to the disposal sites and disposal methods at designated area shall be provided. In addition the proponent is committed to adherence to the occupational health and safety rules and regulations stipulated in Occupational Health and Safety Act, 2007. In this regard, the proponent is committed to provision of appropriate personal protective equipment, as well as ensuring a safe and healthy environment for construction workers as outlined in the EMP.
7.1.6. Increase of disease Vectors

Disease vectors such as rats, flies, and cockroaches increase where refuse is exposed or uncollected and can be a hazard. Complete refuse collection and handling service will be provided by the proponent so that this is not a hazard in compliance with the Public Health Act and as also required in the Occupational Safety and Health Act, 2007 regarding hygiene at the workplace.

7.1.7. Possible Exposure of Workers to Diseases

Possible exposure of workers to diseases from building materials at construction site shall be mitigated by occupational health and safety standards enforcement as required in the OSHA, 2007.

7.1.8. Worker Accidents during Construction and Operation

Workers accidents especially in deep trenching operations and from gas accumulation in sewers and other confined spaces shall be mitigated by enforcing adherence to safety procedures and preparing contingency plan for accident response in addition safety education and training shall be emphasized.

7.1.9. Reduction of Impacts at Extraction Sites and Efficient Use of Raw Materials

The proponent will source building materials such as sand, ballast and hard core from registered quarry and sand mining firms, whose projects have undergone satisfactory environmental impact assessment/audit and received NEMA approval. Since such firms are expected to apply acceptable environmental performance standards, the negative impacts of their activities at the extraction sites are considerably well mitigated.

To reduce the negative impacts on availability and sustainability of the materials, the proponent will only order for what will be required through accurate budgeting and estimation of actual construction requirements. This will ensure that materials are not extracted or purchased in excessive quantities. Moreover, the proponent will ensure that wastage, damage or loss (through run-off, wind, etc.) of materials at the construction site is kept minimal, as these would lead to additional demand for and extraction or purchase materials.

In addition to the above measures, the proponent shall consider reuse of building materials and use of recycled building materials. This will lead to reduction in the amount of raw materials extracted from natural resources as well as reducing impacts at the extraction sites.

7.1.10. Minimization of Run-off and Soil Erosion

The proponent will put in place some measures aimed at minimizing soil erosion and associated sediment release from the project site during construction. These measures will include terracing and levelling the project site to reduce run-off velocity and increase infiltration of rain water into the soil. In addition, construction vehicles will be restricted to designated areas to avoid soil compaction within the project site, while any compacted areas will be ripped to reduce run-off.
7.1.11. Minimization of Construction Waste

It is recommended that demolition and construction waste be recycled or reused to ensure that materials that would otherwise be disposed as waste are diverted for productive uses. In this regard, the proponent is committed to ensuring that construction materials left over at the end of construction will be used in other projects rather than being disposed. Furthermore, damaged or wasted construction materials including cabinets, doors, plumbing and lighting fixtures, marbles and glass will be recovered for refurbishing and use in other projects. Such measures will involve the sale or donation of such recyclable/reusable materials to construction companies, local community groups, institutions and individual residents or home owners.

The proponent shall put in place measures to ensure that construction materials requirements are carefully budgeted and to ensure that the amount of construction materials left on site after construction is kept minimal. It is further recommended that the proponent should consider the use of recycled or refurbished construction materials. Purchasing and using once-used or recovered construction materials will lead to financial savings and reduction of the amount of construction debris disposed of as waste.

Additional recommendations for minimization of solid waste during construction of the project include:-

a) Use of durable, long-lasting materials that will not need to be replaced as often, thereby reducing the amount of construction waste generated over time
b) Provision of facilities for proper handling and storage of construction materials to reduce the amount of waste caused by damage or exposure to the elements
c) Purchase of perishable construction materials such as paints incrementally to ensure reduced spoilage of unused materials
d) Use of building materials that have minimal packaging to avoid the generation of excessive packaging waste
e) Use of construction materials containing recycled content when possible and in accordance with accepted standards.

7.1.12. Reduction of Energy Consumption

The proponent shall ensure responsible electricity use at the construction site through sensitization of staff to conserve electricity by switching off electrical equipment or appliances when they are not being used. In addition, proper planning of transportation of materials will ensure that fossil fuels (diesel, petrol) are not consumed in excessive amounts. Complementary to these measures, the proponent shall monitor energy use during construction and set targets for reduction of energy use.

7.1.13. Minimization of Water Use

The proponent shall ensure that water is used efficiently at the site by sensitizing construction staff to avoid irresponsible water use. The proponent will install water-conserving automatic taps and toilets. Moreover, any water leaks through damaged pipes and faulty taps will be fixed promptly by qualified staff.
7.1.14. Controlling Oil Spills during Construction Phase

The proponent will control the dangers of oil, grease and fuel spills during construction by maintaining the machinery in specific areas designed for this purpose. Machinery site repair will be discouraged and repair work restricted to approved garages to avoid pollution from oil, grease and fuel.

7.1.15. Public Health, Safety and Awareness

a) The contractor should provide a small section of the construction site with a shed and a water stand where the food can be served to the construction workers to promote hygiene and health of the employees.
b) A fully equipped first aid kit should be provided at the site.
c) The contractor must have workmen’s compensation cover as required by law (The Workmen’s Compensation Act), as well as relevant ordinances, regulations and union’s agreements.
d) The workers, immediate neighbour and other stakeholders should be sensitized on the dangers and risk associated with the construction works for enhanced self-responsibility on personal safety.
e) The proponent should ensure that the completed buildings are fitted with safety facilities including fire detectors, fire-fighting equipment, fire exits, adequate access and buffer between the residential premises.
f) Disabled access features and safety signage should be placed strategically around and within the buildings.
g) Appropriate sanitation conveniences should be provided at the site as required in the OSHA, 2007 and echoed in the Public Health Act.

7.1.16. Environmental Monitoring and Grievance Redress Mechanism

The proponent should post an Environmental officer on site to monitor all operations during construction to ensure strict compliance to the EMP and institute a Grievance Redress Mechanism (GRM) where all issues raised by the neighbours will be filed, addressed and responded to accordingly without delay.

7.2. Mitigation of Impacts during Operation Phase

The project will be developed into the Qwetu and Qejani brands of student hostels and will be similar to high end hostels currently operating in Parklands, Jogoo Road and Outserring ring road. The existing facilities have co-existed with the neighbouring communities harmoniously due to the stringent regulations governing student’s behavior and activities within the premises. No noise, parties, alcohol or visitors are allowed within the premises and entry is strictly via student’s biometrics scan / card access thus no strangers can access the premises. Safety measures including fire protection; smoke detectors in every room, portable fire extinguishers and Fire hose reels, are of the highest standards.

7.2.1. Ensuring Efficient Solid Waste Management

The proponent will be responsible for efficient management of solid waste generated by the project during its operation. In this regard, the proponent will provide waste handling facilities such as waste bins and skips for temporarily holding domestic waste generated from
the hostels. Moreover, the proponent will ensure that such waste is regularly and appropriately disposed.

An integrated solid waste management system is recommended. First, the proponent will give priority to Reduction at Source of the materials. This option will demand a solid waste management awareness programme in the management and the residents. Recycling, reuse and composting of the waste will be the second alternative in priority. This will call for a source separation programme to be put in place. The recyclables will be sold to waste buyers within Nairobi City. The third priority in the hierarchy of options is combustion of the waste that is not recyclable in order to produce energy. Finally, sanitary land filling will be the last option for the proponent to consider. The proponent will adhere to the Environmental Management and Coordination (Waste Management), Regulations 2006.

### 7.2.2. Wastewater Management

Waste water from the project site will be connected to a waste water treatment plant (WWTP). The waste water treatment plant is designed with 5 key components. That is:

a) pre-treatment,
b) primary treatment
c) biological treatment i.e. anaerobic and aerobic
d) secondary treatment and
e) Tertiary treatment.

Some key unit operations in the treatment of waste water will include the following.

**Flow equalization** - Flow equalization will be provided to balance / smooth high levels of variations in the influent wastewater flows, expected during the peak flow periods. These flows will be temporarily stored and then discharged later into the biological treatment system at a controlled flow rate. Estimated plant volume at 250m³ equalization tank forms 30% of this volume at 75m³. In this way, the biological treatment process will not be overloaded during peak flows (flushes) of influent arriving at the treatment facilities.

**Screening & Grease Removal**

The wastewater will be screened using a stainless-steel static screen to remove rags and plastics and prevent blockage in the downstream treatment processes. Screening to approximately 5 – 6 mm is required for good downstream process operation. Screening will be cleaned daily to avoid odor.

**Aeration in bioreactors**

The aeration bioreactors are fixed-film reactors, each equipped with a simple system of non-clogging, diffusers used to introduce air in the water. The wastewater is introduced in the reactors and the microorganisms growing as a biological film on the media absorb the organic material in the wastewater and ammonia nitrogen is converted to nitrites and nitrates. Reactors BR series consists of tanks with bed of bio-filter, which serves as a platform for micro-organisms to attach to and grow on, to form a biological film. These tanks are connected in series and water is transferred by gravity through the interconnecting 110mm pipe. The various chambers of the plant which is an underground system are made of concrete material.
Sedimentation in the Settling tank

The secondary clarifier receives the water from the last fixed bed reactor and provides a settlement zone with a funnel shaped bottom for the settlement of the excess bacteria which have been spoiled out of the fixed bed reactors. Submersible motor pumps at the bottom of the chamber remove the accumulated sludge in intervals into the sludge digester tank. This is set at a certain level depending on dimensions of the settling tank (secondary clarifier).

Sludge treatment

The sludge, which gathers at the bottom of the primary and the secondary settling tanks, is pumped several times per day into the sludge digester tank. The sludge treatment reactor consists of aeration grids of membrane tube aerators at the bottom. The aeration grids are supplied with air from an air blower. Existing bacteria degrade the remaining polluting substances contained in the sludge using the oxygen brought into the water. By intervals of long aerated and long non-aerated phases the sludge starts to mineralize and reduces its volume. At the end of the sedimentation phase the supernatant water from the clear water zone is pumped into the equalization tank by pump.

Chlorine Disinfection

Clarified water from the settling tank is discharged into the chlorine contact tank (DT-1700). This tank is sized for an effective contact time in excess of the required 20 min maintaining a 2ppm residual chlorine concentration before discharge. 1.0 kg of 65% chlorine granules is mixed in the 100 liter-dosing tank to form the dosing solution.

Treated waste water will be used for watering lawns, flower beds and cleaning of pavements. All storm water drainage will be channelled into open storm water drain systems. This will be served by 2 submersible drainage pumps pressurizing the system. Excess amount of treated water is directed to external storm water drainage system.

Samples of the treated waste water shall be regularly analysed pursuant to the fourth schedule of the water quality regulations 2006. It will also be important to ensure that sewage pipes are not blocked or damaged so that the waste can be directed to the sewer line since such vices can lead to release of the effluent, resulting in land and water contamination. Such blockages or damages will be fixed expeditiously. Waste water shall be disposed in compliance with the provisions of the Environmental Management and Coordination (Water Quality), Regulations 2006.

7.2.3. Ensure Efficient Energy Consumption

Students will be sensitized to ensure energy efficiency in their domestic operations. Hot water solar heating equipment will be installed. Use of solar will reduce the overall electricity consumption. Furthermore, security lights that have to be kept on throughout the night will be powered by solar. Incandescent bulbs will be highly discouraged.

7.2.4. Ensure General Safety
A competent security firm will be engaged to ensure the general safety and security at all times. The existing perimeter wall will be enhanced by installation of electric fence. The proponent is also advised to install CCTV cameras at strategic zones within the compound.

7.2.5. Ensure Efficient Water Use

The proponent will install water-conserving automatic taps and toilets. Moreover, any water leaks through damaged pipes and faulty taps will be fixed promptly by qualified staff. In addition, the occupants of the facility will be sensitized to use water efficiently.

7.3. Mitigation of Impacts during Decommissioning Phase

7.3.1. Efficient solid waste management

Solid waste resulting from demolition or dismantling works will be managed as described in Section 7.2.1.

7.3.2. Reduction of Dust Concentration

High levels of dust concentration resulting from demolition or dismantling works will be minimized as described in Section 7.1.1.

7.3.3. Minimization of Noise and Vibration

Significant impacts on the acoustic environment will be mitigated as described in Section 7.1.2.

8. ANALYSIS OF PROJECT ALTERNATIVES

8.1. Relocation Option

Relocation option to a different site is an option available for the project implementation. At present the landowner/developer does not have an alternative site. This means that he has to look for the land. Searching for a new site may take long with no guarantees for a suitable find. This project can be termed as a site specific project because it responds to the over ten institutions needs located in Karen region to provide accommodation to their students. Were relocation to an alternative site outside Karen possible, the project will not address some of its key objectives of reducing traffic congestion within Karen as the students would still have to commute daily to and from the hostel and campuses. This would still contribute to insecurity and will not lower the cost of higher education. This would also lead to a situation like No Project Alternative option. The other consequence of this is that it would discourage private/local investors especially in the housing sector. In consideration of the above concerns and assessment of the current proposed site, relocation of the project is not a viable option.

8.2. No Project Alternative

The No Project option in respect to the proposed project implies that the status quo is maintained. This option is the most suitable alternative from an extreme environmental perspective as it ensures non-interference with the existing conditions. This option will however involve several losses both to the landowner and the community as a whole. The landowner will continue to pay rent for the plot while the plot remains idle hence no income to the owner. The No Project Option is the least preferred from the socio-economic and partly environmental perspective due to the following factors among others:

- It may lead to further land use change (especially agricultural to housing) elsewhere
- It will jeopardize the goal of increasing more safe and affordable student residences
- No employment opportunities will be created for thousands of Kenyans who will work in the proposed project area and the nearby towns
- Breach of contract with the land seller, CUEA, who specifically stated that the land to be used for students residences as they had intended in the first place

From the analysis above, it becomes apparent that the No Project alternative is not an alternative to the proponent, local people, and the government of Kenya.

8.3. Alternative project scope and scale

The project proponent has the option of reducing the project scope to cater for a smaller population of students by reducing the scale of the development. In the project conceptualization, the proponent considered that university enrollment in Kenya has increased from 27,000 in 1989 to 560,000 in 2016. Out of this student population, 19,875 were students enrolled in campuses within Karen region alone. It’s also noteworthy to consider the UN population projections for Africa whereby the UN predicts that the current 400 million urban citizens will exceed 750 million by 2030 and will reach 1.2 billion by 205016. The increasing population will require adequate facilities at learning institutions that

are mostly located in cities. It is also plausible to note that while urban population increases the size of land available for development will continue to decrease.

To decrease the project scope, the proponent would not have made a futuristic investment that can respond to the current student needs while anticipating the future student population needs too as advocated by Environmentalists under the concept of “sustainable development”. To cater for the student population under a reduced project scope will also require almost “all parcels” of land in Karen area to be turned into student residences if the country ever hopes to achieve affordable education and accommodation for the student population.

The Universities Act Cap 210B, seeks to “promote university education for the benefit of the people of Kenya through the establishment and progressive development of public universities.” However, the Government is not expressly obligated to provide residences for students. A student without accommodation cannot concentrate on his studies and one with a safe residence will be keen to ensure that the areas general security is guaranteed. Qwetu and Qeji seeks to feel the lacunae in the Universities (Establishment of Universities) Standardization, Accreditation and Supervision Rules, 1989 which does not list housing and/or accommodation as a resource to be considered by the Commission for Higher Education when reviewing an application for the establishment of a university. The project will support the existing and licensed higher education institutions within the area.

8.4. The proposed development alternative

Under the proposed development alternative, the developer will be issued with an EIA License. In issuing the license, NEMA will approve the proponent’s proposed development. The proponent will be required to implement the project in line with the licensing conditions and the proposed environment management plan.

8.5. Analysis of Alternative Construction Materials and Technology

The proposed project will be constructed using modern, locally and internationally accepted materials to achieve public health, safety, security and environmental aesthetic requirements. Equipment that saves energy and water will be given first priority without compromising on cost or availability factors. The concrete columns and walls will be made using locally sourced stones, cement, sand (washed and clean), metal bars and fittings that meet the Kenya Bureau of Standards requirements.

Beautiful and durable re-enforced concrete roofs because they are good in heat insulation with minimal (if any) iron sheet roofs are to be used. Heavy use of timber during construction is discouraged because of destruction of foresis. The exotic species would be preferred to indigenous species in the construction where need will arise. However, this construction methods and technologies to be used will require very little timber.
9. ENVIRONMENTAL MANAGEMENT/MONITORING PLAN

9.1. Introduction

An Environmental Management/ Monitoring Plan (EMP) has been developed to assist the proponent in mitigating and managing environmental impacts associated with the life cycle of the project. It is noteworthy that key factors and processes may change through the life of the project and considerable provisions have been made for dynamism and flexibility of the EMP. As such, the EMP will be subject to a regular regime of periodic review during project implementation.

Table 4, Table 55 and Table 66 form the core of this EMP for the construction, operational and decommissioning phases of the proposed project respectively. In general, the Tables outline the potential safety, health and environmental risks associated with the project and detail all the necessary mitigation measures, their financial costs, as well as the persons responsible for their implementation and monitoring. The EMP will be used as checklist in future environmental audits.

9.2. Cost of mitigation

Using best practices in other parts of the world, the costs of the mitigation measures and of the institutional and training requirements to implement them will be estimated with a ceiling budget of approximately 2.5% of the total project cost. A comprehensive work program, budget estimates, schedules, staffing and training requirements, and other necessary support services to implement the mitigating measure will be prepared based on this budget guideline.

9.3. EMP for demolition phase

9.3.1. Introduction

The building earmarked for demolition is a single dwelling house. It is made of concrete walls reinforced by steel bars and wood frames. The foundation is also concrete while the floor is made of white tiles. The roof is made red tiles while the doors and windows are a mix of steel and wood. The building will be demolished to create space or the incoming project.

9.3.2. Objective

The prime objective is to implement and EMP during demolition of the buildings. Specific objectives are:

- To demolish the building considering the safety so as to ensure the protection of the worker, general public, and adjacent property;
- To demolish the existing building adopting the standard safety measures and segregate the debris in to recyclable and non-recyclable for proper disposal and management of wastes;
- To separate out the potential hazardous materials and dispose with proper environmental management and safety;
- Transport and dispose materials which cannot be reused and recycled in safety manners.
9.3.3. Demolition process

Demolition of the building involves several activities of them foremost step would be a detailed pre-demolition preparatory works such as desired equipment, manpower, removing hazardous or regulated materials, obtaining necessary permits from the authority, submitting necessary notifications, disconnecting utilities, and development of site-specific safety and work plans for the workforce among others. Extra care should be taken while the demolition is in progress. The demolition EMP is presented in Table 3: EMP for demolition below.
<table>
<thead>
<tr>
<th>Environmental Impacts</th>
<th>Mitigation measures</th>
<th>Implementat ion stage</th>
<th>Mitigation cost</th>
<th>Responsible party</th>
</tr>
</thead>
</table>
| Air, Noise and Dust Pollution During the Dismantling of the building                  | - Water spraying at the demolition site  
- Fencing / Install barriers (GI sheets, geo-net) to shield from dust and aggregates  
- Avoid usage of machines/equipment with extra noise;  
- Do not accumulate and burn waste at the site  
- Comply with the provisions of Noise Prevention and Control Rules 2005, Legal notice no. 24 regarding noise limits at the workplace | Demolition            | 10,000          | Contractor and proponent          |
| Land pollution                                                                       | - In case of hazardous waste store in safe place and make the provision for management  
- Dispose at the designated site identified in coordination with the County Government of Nairobi | Demolition            | 5,000           | Contractor and proponent          |
| Disturbance to the neighbouring Population and pedestrians                           | - Install barriers (Hessian cloth/ scaffolding net) to shield from dust and aggregates  
- Give prior notice of activities to the neighbouring stakeholders  
- Restrict demolition works to daytime between 8:00am and 5:00pm | Demolition            | 10,000          | Contractor and proponent          |
| Vibration Impact                                                                     | Precaution should be taken while using the machines and equipment, during demolition  
Comply with the provisions of Noise Prevention and Control Rules 2005, Legal notice no. 24 regarding noise limits at the workplace                                                                                                                                | No cost              |                 | Contractor and proponent          |
| Impacts due to the disposal of waste materials                                        | - The solid waste will be segregated at source level and collected in a separate container  
- Reusable or useful materials like, building blocks doors and metal reinforcements will be sold to willing buyers  
- Debris will be disposed at designated sites considering all the environment factors | Demolition            | 5,000           | Contractor and proponent          |
| Safety for the Demolition Workers                                                     | - Make mandatory the use of safety gears (helmets, safety belts, masks, gloves and boot) by workers depending on nature of work  
- Workers will be provided with first aid and health facilities at the site  
- There will be provision for group accidental insurance for the workers  
- Adhere to provisions of O:IS, 2007 guidelines. | Demolition            | 10,000          | Contractor and proponent          |
9.4. EMP for construction phase

The necessary objectives, activities, mitigation measures, responsibilities and monitoring indicators pertaining to prevention, minimization and monitoring of significant negative impacts and maximization of positive impacts associated with the construction phase of the proposed project are outlined in Table 4 below.

**8 Ensure Environmental Compliance**

Undertake an environmental audit within 12 months after operation commences as required by law

| | Consultant | 12 months after operation commences (150,000) | Number of improvement notices and compliance letters obtained |

9.6. Decommissioning Phase

In addition to the mitigation measures provided in Table 4 and Table 5, it is necessary to outline some basic mitigation measures that will be required to be undertaken once all operational activities of the project have ceased. The necessary objectives, mitigation measures, allocation of responsibilities, time frames and costs pertaining to prevention, minimization and monitoring of all potential impacts associated with the decommissioning and closure phase of the project are outlined in Table 6 below.

**Table 6: EMP for Decommissioning Phase**

</tbody>
</table>
10. CONCLUSION AND RECOMMENDATION

10.1. Conclusions

1) The proposed development is in line with Kenya’s goal to build safe learning and boarding facilities for student in higher education.

2) Key positive impacts that will result from the project include; growth of the economy, boosting of the informal sector during the construction phase, provision of market for supply of building materials, employment generation, increase in government revenue and optimal use of land.

3) Negative environmental impacts that will result from establishment of the proposed project which include pressure on the existing facilities, noise pollution, dust emissions, solid waste generation, increased water demand, increased energy consumption, generation of exhaust emissions, risk of workers accidents, possible exposure of workers to diseases.

4) Negative impacts can be sufficiently mitigated by implementation of the proposed Environment Management Plan

10.2. Recommendations

1) The proponent to implement the measures outlined in the EMP as well as adhering to all relevant national and international environmental, health and safety standards, policies and regulations that govern establishment and operation of such projects.

2) Maximize positive impacts as much as possible as exhaustively outlined within the report. This will ensure the best possible environmental compliance and performance standards.

3) Additionally, use solar PV especially for lighting streets and pavements/ walkway lighting. This will reduce demand for fossil fuels in power generation hence curbing GHG emissions.

4) The building will be IFC Edge compliant with applications that can support the environmental aspect of the project i.e. low flow taps, low flow shower heads, LED lighting among others.

This proposed project is recommended for licensing.
